Part A of the project: gathering information and statement of intentions

- Identify and explain the idea for the final project - a network from the worlds of behavioral sciences / psychology / cognition / language / social networks, etc., from which you can learn about human behavior or traits.
  In addition, you must write an informative background describing the phenomenon you have chosen to investigate through network analysis, and how your analysis relates to the phenomenon and will advance its understanding.

- Collect data that can be turned into one or more networks, which you will analyze throughout the project. In particular, you must indicate the source of the information and describe it. It is possible and even desirable to collect information for several networks and compare them, depending on the subject of the project.

- Defining the purpose and questions of the research - what is the purpose of the research, what questions do you plan to answer and what are the relevant hypotheses.

- Specify what the nodes and arcs are, whether the network is directed or not, etc.
